Statistics: Mean 18.436; Variance 54.674; scale 0.337

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fused protein recognised by pemphigus vulgaris auto:antibody - useful to treat and diagnose pemphis vulgaris Claim 1; Page 7-9; 9pp; Japanese.
W07908 represents the human pemphigus vulgaris (PV) antigén extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-pidermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                       DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure; Fig 7; SOpp; English.
This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                          N-PSDB; Q35992
                                                                                                                                                                                                                                                                                                                                                                                                                                   27-NOV-1991; 798918.

This sequence represents a fused protein recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region of pemphigus foliaceus antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus foliaceus. The antigen is especially administered through an adsorbent upon which the fusion protein is immunobilised via a carrier. The fusion protein is useful to treat pemphigus foliaceus antibodies which is useful in immunodiagnosis. The fusion protein has little or no side effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

It cas a mol.wt. of 150 kDa exclusive of glycosylation and contains 21 potential N-linked glycosylation sites. The amino acid sequence was deduced from an clone E2 cDNA (see T89387). The 22 gene in plasmid pri8E2 (E. coli JM105) is deposited as ATCC E2 gene in plasmid pri8E2 (E. coli JM105) is deposited as ATCC 68041. The BCV E3 gene (see T89388) is immediately 5' of the E2 component the E2 initiation codon. The E2 and E3 genes have been contracted and can be used for the recombinant production of BCV polypeptides, using e.g. Spodoptera frugleperda Sf9 insect cells as host cells. Glycosylated and non-glycosylated recombinant E2 and E3 (see W31707) are useful as components of vaccines of irected toward preventing BCV infection, or reducing the severity of BCV infection, in bovine populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

E2 protein is one of the four proteins (N, E1, E2 and E3)

ECV. The E2 and E3 polypeptides, or fragments of these, a subunit antigens in vaccines for protection against or ame BCV, without risk of infection.

Sequence 1363 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           coronavirus polypeptide(s)

The human E-cadherin protein precursor (R85487) is expressed by an CDNA clone (T05764) derived from human liver. The extracellular domain of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphocytes to E-cadherin expressing epithelial or endothelial cells in vitro or in vivo, thereby modulating nucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to E-cadherin and that can inhibit T-cell binding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          uvomorulin, L-CAM and Cell CAM 120/80. The DNA encoding hEC was obtd. by screening normal human liver and hepatocellular carcinoma cDNA clibraries and a colonic epithelial cell cDNA library. The following sequences are specifically claimed: AAS 1-878; 151-878; 30 sequential AAS from AAS 308-878; AAS 1-150; AAS 178-289; AAS 290-401; AAS 402-513; AAS 178-513; AAS 151-703; AAS 1790-379; AAS 704-878; nucleotide sequences comprising nucleotide numbers life-2749; 566-2749; 1-1053; 510-2696; 1332-3000; 540-1500; 348-906; 890-1648; 384-1208; 641-2046; 685-1335; 880-1661; 1199-1742; 1373-1742; 1705-2204; 2458-2775; DNA encoding at least 30 AAS selected from AAS 308-878. The prods. can be used in the diagnosis, prognosis, therapy and prophylaxis of conditions involving improper E-cadherin expression. Suitable dosages for i.v. admin. of a protein are 50-500 mcg/kg body wt.
                                                                                                                                                                                                                                                                                     Query Match

Claim 2; Fig 1f; 20pp; Japanese.

DNA encoding the protein can be inserted into an expression vector for the prodn. of MG-1 polypeptide which elicits an antigen-antibody reaction with anti-mycoplasma gallisepticum poultry sera. It may also be ligated to other DNA to produce fusion proteins with an N-terminal

This sequence represents the human Trabecular meshwork induced glucocorticoid response (TIGR) protein. The TIGR protein is a secretory protein specifically bound by the antibody of the invention. The antibody, especially in labelled form, can be used in the diagnosis of glaucoma by detecting elevated levels of the protein in the trabecular meshwork of the eye. Using the antibody, glaucoma is detected more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pea seeds lacking plastidial phosphoglucomutase activity - have higher sucrose levels at end of vining period and can be vined over extended period compared to conventional varieties Disclosure; Page 58-62; 83pp; English.

This protein comprises pea plastidial phosphoglucomutase (PGM(p)), an enzyme that catalyses the interconversion of glucose-1-phosphate and glucose-6-phosphate, and is thus involved in starch synthesis. The amino acid sequence was deduced from an isolated cDNA clone (see Y00731) and shows considerable homology to known PGM sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides pea plants that have substantially reduced PGM(p) activity or which substantially lack PGM(p) activity. This may be the result of antisense or sense suppression technology. Pea seeds from such plants have higher sucrose levels at the end of the vining period and may be vined over an extended period compared to conventional varieties. The invention provides pea seeds having a sucrose content of over 6% of total weight, and a ratio of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 98-101065/09.

PT New Isolated glaucoma-associated nucleic acids - which encode
PT Trabecular Meshwork Induced Glucocorticoid Response protein, used to
PT develop products for diagnosing glaucoma-related diseases
Claim 1; Fig 1; 22pp; English.
CC The present sequence is a human secretory protein from clone II.2.
CC The secretory protein is designated TIGR (Trabecular Meshwork Induced CG Glucocorticoid Response) protein. The protein is highly induced by
CC glucocorticoids in the endothelial lining cells of the human trabecular
CC meshwork. The TIGR polynucleotides and proteins can be used as markers
CC for the diagnosis of glaucoma, primary open angle glaucoma (POAG),
CC pigmentary glaucoma, and low tension glaucoma and their related
CC diseases. They can also be used to diagnose or protect an individual's
CC sensitivity to elevated intraocular pressure upon administration of
CC steroids such as glucocorticoids or corticosteroids. These products can
CC also be used for diagnosing other diseases or conditions that affect the
CC expression or activity of the protein. The products can also be
CC formulated for administration to patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

products for diagnosis, prognosis and treatment of glaucoma Claim 48; Fig 8; 105pp; English.

This sequence represents a novel human trabecular meshwork induced glucocorticoid response protein (TIGR) which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and within TIGR exons can also be used to diagnose glaucoma.
                                                                                                                                                                                                      N-PSDB; V51391.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). -(POTENTIAL).

DISEASE: PENDHIGUS VULGARIS (PV) IS A POTENTIALLY LETHAL SKIN DISEASE IN WHICH EPIDERMAL BLISTERS OCCUR AS THE RESULT OF THE LOSS OF CELL-CELL ADHESION CAUSED BY THE ACTION OF AUTOANTIBODIES AGAINST DSG3. SIMILARITY: BELONGS TO THE CADHERIN FAMILY. BELONGS TO THE DESMOSOMAL SUBFAMILY.

"The nucleotide sequence and genome organization of strawberry mil
yellow edge-associated potexvirus.";

J. GEN. VIROL. 73:475-479(1992)

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

-!- SIMILARITY: TO ORF3 PROTEIN FROM OTHER POTEXVIRUSES AND TO 12
PROTEIN FROM CARLAVIRUSES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CARBOHYD

-!- FUNCTION: THIS IS A SEED STORAGE PROTEIN.

-!- SUBUNIT: HEXAMER; EACH SUBUNIT IS COMPOSED OF AN ACIDIC AND A BASIC CHAIN DERIVED FROM A SINGLE PRECURSOR AND LINKED BY A DISULFIDE BOND.

-!- SIMILARITY: BELONGS TO THE 11S SEED STORAGE PROTEINS (GLOBULINS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright.
